# Currency appreciation and the RBA

## Strong dollar matters less than slower activity

Australia's import price number Friday will pick up the both the sharp Australian dollar appreciation and a big increase in oil and distillate prices over the previous quarter. On balance the outcome is likely to be a fall in import prices, but probably not as big as the 1.7% drop in the previous quarter. It is marginally relevant to next week's second quarter CPI, but the RBA doesn't pay nearly as much attention to the presumed inflation impact of exchange rate changes as is widely believed. The central bank has long recognised that an Australian dollar at USD0.50 has no more impact on inflation than an Australian dollar at USD0.95. The only inflation impact is in the move between the two levels. This matters in the June quarter, when the currency moved from USD0.78 to USD0.85. It probably won't matter much in the current quarter, because the currency has been fairly stable. The RBA also recognises that what is won in the swings of the exchange rate is lost on the roundabouts. Nor will the RBA be much fussed by higher oil and petrol prices over the quarter. They will be knocked out of the trimmed mean core measure of retail price inflation, which is the measure that matters.

Given the flow of economic activity numbers over the past few weeks, the RBA needs to see a solid core increase in inflation before it could contemplate tightening in August. Retail sales turnover was down in both April and May, home building approvals and mortgage lending were down for May, and last week we saw that June employment was up only 2,500 – well below the run of increases in recent months. We think it is just a pause. High migration, accumulated unmet demand and rising incomes will stimulate home construction, mining exports are now picking up, and the drought is ending. Even so the RBA likes to feel its way and the current numbers do not support urgency in another tightening.

We look for a 0.9% increase in the headline CPI on Wednesday of next week – a forecast that is towards the bottom of the range. Higher petrol prices account for most of the difference between the underlying rate of around 0.6% and the headline. We expect 0.6% for the trimmed mean – not high enough to motivate an increase now, or to require an increase in the inflation forecast for 2008. For the first time the Australian Bureau of Statistics will publish the trimmed mean, instead of the Reserve Bank. This mean it will be available at the same time as the headline rate. The ABS will use the RBA's methodology, which for the trimmed mean is to remove 15% of the tails at either end of the distribution. These are the prices which have changed most. The trimmed mean is then the average change of the remaining 70% of items in the CPI basket. Unlike the CPI itself, the items in the trimmed mean are seasonally adjusted, where there is an identifiable seasonal pattern. Hitherto the RBA has not been able to concurrently seasonally adjust the most recent number, because it did not have access to the ABS

numbers before release. The ABS will have the seasonally adjusted current number on release, and also where necessary revise previous numbers for changes in the seasonal pattern. Because there are a number of items which regularly increase in the first quarter, especially school fees, seasonal adjustment would likely take the first quarter trimmed mean down compared to the raw trimmed mean data, and the other three quarters correspondingly up. But if the seasonal adjustment is correct, the statistical process itself does not change the likelihood of the seasonally adjusted second quarter number being higher or lower than the seasonally adjusted first quarter number.

## Big numbers in NZ

### Q2 inflation OK, but activity strong

RBNZ Governor Alan Bollard would be delighted to see in that economy the recent run of numbers for the Australian economy. New Zealand retail sales did indeed fall in April, as they did in Australia. For May however, they rose 1.2% in New Zealand while falling again in Australia. Australian dwelling approvals fell 5.6% in May, but the seasonally adjusted series rose 5.6% in New Zealand. Through the year New Zealand retail sales were up 6.6% to May, outpacing the increase of 5.7% in Australia. Permits for new home construction (or approvals, in the Australian terminology) have fallen 7.2% in Australia in the year to May. In New Zealand they were the same in May this year as May last year. Dr Bollard is explicitly seeking (according to the most recent Monetary Policy Statement) several years of below trend growth. Business confidence is down and house price growth has moderated (though still double digit) but the only sector showing real signs of a slowdown is exports. For the year to May Australian exports were up 10%. In New Zealand they were down 8%.

For today's second quarter CPI we expect to see an increase of 0.6% - below consensus of 0.8% and only a little above the 0.5% increase last time. Food prices did not increase in the second quarter as fast as in the second quarter, and while petrol prices increased they rose by less than in Australia. Statistics New Zealand publishes a trimmed mean measure, which we expect to see come in at 0.5%, compared to 0.6% last time. As we have explained before, the RBNZ is so focused on activity indicators and its goal of slowing demand and output growth that it pays correspondingly less attention to the contemporary price indicators. Even if we do see quite reasonable headline and core increases today, it will still take more moderation in the activity indicators to remove the threat of another tightening.

**John Edwards**
